LAMA5 & LAMC1 Protein Protein Interaction Antibody Pair

Catalog #: DI0341 規格:[1 Set]

List All

Specification

Product Description:

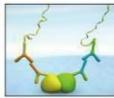

This protein protein interaction antibody pair set comes with two antibodies to detect the protein-protein interaction, one against the LAMA5 protein, and the other against the LAMC1 protein for use in <u>in situ Proximity Ligation Assay</u>. See Publication Reference below.

Application Image

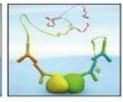

In situ Proximity Ligation Assay (Cell)

 Incubate with target primary antibodies

2. Add PLA probes PLUS and MINUS

3. Hybridize connector oligos

 Ligation to form a complete DNA circle

Rolling circle amplification

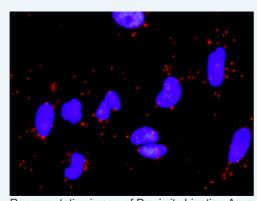

Add fluorescent probes
to reveal interaction

Reactivity:

Human

Quality Contro Testing:

Quality Control Protein protein interaction immunofluorescence result.

Representative image of Proximity Ligation Assay of protein-protein interactions between LAMA5 and LAMC1. HeLa cells were stained with anti-LAMA5 rabbit purified polyclonal antibody 1:1200 and anti-LAMC1 mouse monoclonal antibody 1:50. Each red dot represents the detection of protein-protein interaction complex. The images were analyzed using an optimized freeware (BlobFinder) download from The Centre for Image Analysis at Uppsala University.

Supplied Product:

Antibody pair set content:

- 1. LAMA5 rabbit purified polyclonal antibody (20 ug)
- 2. LAMC1 mouse monoclonal antibody (40 ug)

*Reagents are sufficient for at least 30-50 assays using recommended protocols.

Storage Instruction: Store reagents of the antibody pair set at -20°C or lower. Please aliquot to avoid repeated freeze thaw cycle. Reagents should be returned to -

20°C storage immediately after use.

Applications

In situ Proximity Ligation Assay (Cell)

LAMA5 LAMC1

Gene Information

Entrez GeneID: 3911

Gene Name: LAMA5

Gene Alias: KIAA1907

Gene laminin, alpha 5

Description:

Omim ID: <u>601033</u>

Gene Ontology: Hyperlink

Gene Summary: Components of the extracellular matrix exert myriad effects on tissues

throughout the body. In particular, the laminins, a family of heterotrimeric extracellular glycoproteins, affect tissue development and integrity in such diverse organs as the kidney, lung, skin, and nervous system. It is thought that laminins mediate the attachment, migration, and organization of cells into tissues during embryonic development by interacting with other extracellular matrix components. Laminins function as heterotrimeric complexes of alpha, beta, and gamma chains, with each chain type representing a different subfamily of proteins. The protein encoded by this gene belongs to the alpha subfamily of laminin chains and is a major component of basement membranes. Two transcript variants encoding different isoforms have been found for this gene, but the full-length nature of one of them has not been

determined. [provided by RefSeq

Designations:

Gene Information

Entrez GeneID: 3915

Gene Name: LAMC1

Gene Alias: LAMB2,MGC87297

Gene laminin, gamma 1 (formerly LAMB2)

Description:

Omim ID: <u>150290</u>, <u>176780</u>

Gene Ontology: Hyperlink

Page 2 of 3 2016/5/19

Gene Summary: Laminins, a family of extracellular matrix glycoproteins, are the major noncollagenous constituent of basement membranes. They have been implicated in a wide variety of biological processes including cell adhesion, differentiation, migration, signaling, neurite outgrowth and metastasis. Laminins are composed of 3 non identical chains: laminin alpha, beta and gamma (formerly A, B1, and B2, respectively) and they form a cruciform structure consisting of 3 short arms, each formed by a different chain, and a long arm composed of all 3 chains. Each laminin chain is a multidomain protein encoded by a distinct gene. Several isoforms of each chain have been described. Different alpha, beta and gamma chain isomers combine to give rise to different heterotrimeric laminin isoforms which are designated by Arabic numerals in the order of their discovery, i.e. alpha1beta1gamma1 heterotrimer is laminin 1. The biological functions of the different chains and trimer molecules are largely unknown, but some of the chains have been shown to differ with respect to their tissue distribution, presumably reflecting diverse functions in vivo. This gene encodes the gamma chain isoform laminin, gamma 1. The gamma 1 chain, formerly thought to be a beta chain, contains structural domains similar to beta chains, however, lacks the short alpha region separating domains I and II. The structural organization of this gene also suggested that it had diverged considerably from the beta chain genes. Embryos of transgenic mice in which both alleles of the gamma 1 chain gene were inactivated by homologous recombination, lacked basement membranes, indicating that laminin, gamma 1 chain is necessary for laminin heterotrimer assembly. It has been inferred by analogy with the strikingly similar 3' UTR sequence in mouse laminin gamma 1 cDNA, that multiple polyadenylation sites are utilized in human to generate the 2 different sized mRNAs (5.5 and 7.5 kb) seen on Northern analysis.
