Gene Summary: Pleomorphic adenoma gene 1
encodes a zinc finger protein with 2 putative nuclear
localization signals. PLAG1, which is developmentally
regulated, has been shown to be consistently rearranged
in pleomorphic adenomas of the salivary glands. PLAG1

is activated by the reciprocal chromosomal
translocations involving 8q12 in a subset of salivary
gland pleomorphic adenomas. Three transcript variants
encoding two different isoforms have been found for this
gene. [provided by RefSeq]
