Gene Summary: The protein encoded by this gene is
thought to be a transcriptional corepressor. However,
molecules that interact with this protein have not yet
been identified. The protein is a member of the tripartite

motif family. This motif includes three zinc-binding
domains, a RING, a B-box type 1 and a B-box type 2,
and a coiled-coil region. Three alternatively spliced
transcript variants for this gene have been described,
however, the full-length nature of one variant has not
been determined. [provided by RefSeq]
