Gene Summary: The product of this gene belongs to
the family of G-protein coupled receptors. This family
has several receptor subtypes with different
pharmacological selectivity, which overlaps in some

cases, for various adenosine and uridine nucleotides.
This receptor is involved in platelets aggregation, and is
a potential target for the treatment of thromboembolisms
and other clotting disorders. Two transcript variants
encoding the same isoform have been identified for this
gene. [provided by RefSeq]
