Human Dorsal Root Ganglion Paraffin Sections

Cat. HP-240

Human Dorsal Root Ganglion paraffin sections are made of freshly harvested tissues, fixed in 10% neutral buffered formalin, and processed for paraffin embedding. Paraffin blocks are sectioned at a thickness of 5microns and mounted on positively charged slides (2-4 sections per slide depending on tissue size).

Quality Control: Tissue sections are H&E stained and examined by histologists with 28 years of experience to be sure of excellent morphology and high quality.

Applications: Paraffin tissue sections are prepared in RNase-, DNase-, and protease-free environment and are ideal for immunohistochemistry and *in situ* hybridization.

Packing/shipping: Paraffin sections are shipped in tightly closed slide boxes or slide mailers at room temperature and are good for one year if properly stored.
