Cat #: KD-010

Description: Monkey Tissue cDNA Panel, Cynomolgus, any 10 tissues

Monkey cynomolgus full length tissue cDNA panel is your choice of any 10 cDNA samples (10 reactions each).

The full length tissue cDNA panel is made of RNA extracted from freshly harvested tissues of single healthy normal donor using classical guanidine isothiocyanate-phenol:chloroform extraction method. RNA is treated with RNase-free DNase-1 to remove residual DNA. The cDNA is primed with oligo dT primer.

Quality Control: The integrity of each RNA sample as indicated by intact ribosomal RNA is verified by denatured agarose gel electrophoresis. The purity of RNA is assessed by spectrophotometer (A260/A280: 1.9-2.1). Residual DNA contamination is tested by PCR.

The synthesized cDNA is also used as template for PCR amplification of β -actin gene. PCR product of β -actin was visualized on 1% agarose gel.

Applications: cDNA is ideal for gene expression analysis by PCR, characterization of alternative splicing of mRNA, verification of genetic mutation, gene cloning and target sequencing.

Packing/shipping: each cDNA sample is routinely shipped on dry ice in 1.5 ml vials.
