Specifications of RNA:

All RNA samples are extracted from tissues using classical guanidine thiocyanate and phenol:chloroform extraction methods to include all total RNA including microRNA. RNA is then treated with RNase-free DNase to remove residual DNA, precisely quantified, and stored at -80°C. The integrity of each RNA sample as indicated by intact ribosomal RNA is verified by denatured agarose gel electrophoresis. The purity of RNA is assessed by spectrophotometer (A260/A280: 1.9-2.1).

RNA is ideal for Northern blotting, ribonuclease protection assay, SI nuclease assay, RT-PCR/Q-PCR analysis, rapid amplification of cDNA ends (RACE) and purification of mRNA for library construction.

Total RNA is provided in RNase-free water, 1mM sodium citrate, or 0.1 mM EDTA at a concentration of 1 mg/ml and shipped on dry ice.
