UT501a : Endometrioid carcinoma tissue array with normal tissue as control, including TNM, clinical stage and pathology grade, 50 cases/ 50 cores

Microarray Panel	Endometrioid carcinoma tissue microarray with normal tissue, containing 41 cases of endometrioid adenocarcinoma, plus 2 each of serous adenocarcinoma and clear cell adenocarcinoma, 5 cases of normal tissue, single core per case	
Cores	50	UT501a H&E 
Cases	50	
Row number	5	
Column number	10	
Core Diameter (mm)	1.5	
Thickness (µm)	5	
Tissue Array Type	FFPE	
Species	Human	
Applications	Routine histology procedures including Immunohistochemistry (IHC) and In Situ Hybridization (ISH), protocols which can be found at our support page.	
Notes	1. TMA slides were sectioned and stored at 4°C and may not be fresh cut, but still suitable for IHC. Please request fresh cut if experiment involves phospho-specific antibodies, RNA studies, FISH or ISH, etc. A minimum of 3 slides per TMA must be purchased to cover the cost of trimming for fresh sectioning. 2. Most TMA slides were not coated with an extra layer of paraffin (tissue cores can be easily seen on the glass). To prevent tissue detachment during antigen retrieval, unbaked slides must be baked for at least 30 to 120 minutes at 60°C. before putting into xylene for de-paraffinization. Baked slides were sent out baked for 2 hours. In the following specsheet, "*" means invalid core; "-" means no applicable or negative in IHC markers.
