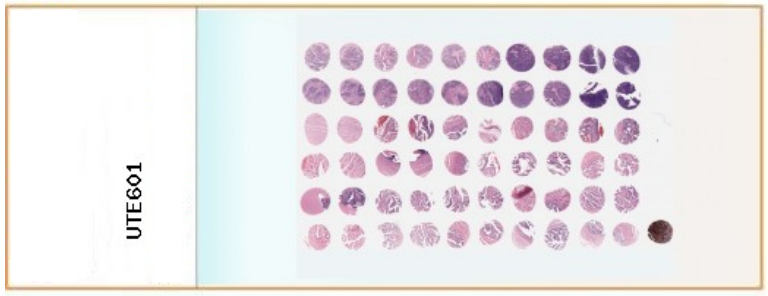
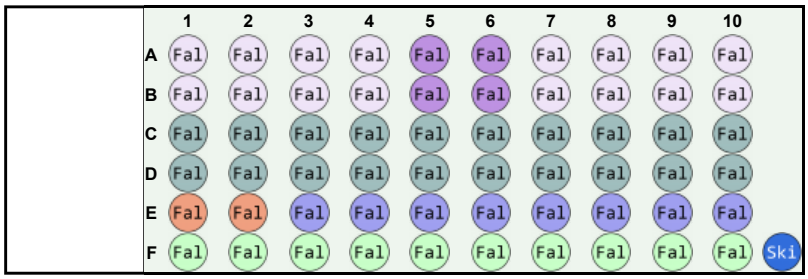
UTE601 : Fallopian tube disease spectrum (fallopian tube cancer progression) tissue array, including pathology grade, TNM and clinical stage, 30 cases/60 cores

Microarray Panel	Oviductal carcinoma tissue microarray, containing 10 cases of each adenocarcinoma and inflammation, 1 hyperplasia, 4 adjacent normal tissue and 5 normal tissue, duplicated cores per case
Cores	60
Cases	30
Row number	6
Column number	10
Core Diameter (mm)	1.5
Thickness (μm)	5
Tissue Array Type	FFPE
Species	Human
Applications	Routine histology procedures including Immunohistochemistry (IHC) and In Situ Hybridization (ISH), protocols which can be found at our support page.
Notes	1. TMA slides were sectioned and stored at 4°C and may not be fresh cut, but still suitable for IHC. Please request fresh cut if experiment involves phospho-specific antibodies, RNA studies, FISH or ISH, etc. A minimum of 3 slides per TMA must be purchased to cover the cost of trimming for fresh sectioning. 2. Most TMA slides were not coated with an extra layer of paraffin (tissue cores can be easily seen on the glass). **To prevent tissue detachment during antigen retrieval, unbaked slides must be baked for at least 30 to 120 minutes at 60°C**. before putting into xylene for de-paraffinization. Baked slides were sent out baked for 2 hours. In the following specsheet,"*" means invalid core; "-" means no applicable or negative in IHC markers.

UTE601 H&E





Legend:Fal - Fallopian tube
- Hyperplasia, - Inflammation, - Malignant tumor, - Malignant tumor (stage I), - Malignant tumor (stage IA), - Malignant tumor (stage IC), - Malignant tumor (stage II), - NAT, - Normal tissue

, tissue IDs are available in exported Excel files.
