Reference	Wang,J., (2008) Clin. Pharmacol. Ther. 83 (5), 711-717
Description of Target	IMPDH1 acts as a homotetramer to regulate cell growth. It is an enzyme that catalyzes the synthesis of xanthine monophosphate (XMP) from inosine-5'-monophosphate (IMP). This is the rate-limiting step in the de novo synthesis of guanine nucleotides. Defects in this gene are a cause of retinitis pigmentosa type 10 (RP10).
Protein Interactions	UBC; LAMP2; IMPDH2; XRCC6; GMNN; HTRA1; DDX3X; SUMO4;
Reconstitution and Storage	All conjugated antibodies should be stored in light-protected vials or covered with a light protecting material (i.e. aluminum foil). Conjugated antibodies are stable for at least 12 months at 4C. If longer storage is desired (24 months), conjugates may be diluted with up to 50% glycerol and stored at -20C to -80C. Freezing and thawing conjugated antibodies will compromise enzyme activity as well as antibody binding.
