Product Information

CF® Dye dCTP Conjugates

Catalog no.	Dye/Product	Unit size	Ex/Em (nm)	MW (free acid form)
40067-T	CF@488A-dCTP	5 nmol	490/515	~1428
40067		25 nmol		
40057-T	CF@532-dCTP	5 nmol	527/558	~1624
40057		25 nmol		
40058-T	CF@543-dCTP	5 nmol	541/560	~1647
40058		25 nmol		
40027-T	CF@555-dCTP	5 nmol	555/565	~1553
40027		25 nmol		
40055-T	CF@568-dCTP	5 nmol	562/583	~1652
40055		25 nmol		
40056-T	CF@594-dCTP	5 nmol	593/614	~1667
40056		25 nmol		
40066-T	CF@640R-dCTP	5 nmol	642/662	~1593
40066		25 nmol		
40028-T	CF@647-dCTP	5 nmol	650/665	~1579
40028		25 nmol		
40068-T	CF@660R-dCTP	5 nmol	663/682	~1826
40068		25 nmol		

Storage and Handling

Store desiccated at $\leq -20^{\circ}\text{C}$, protected from light. Product is stable for at least 6 months from date of receipt when stored as recommended.

For aqueous solutions, prepare single use aliquots and store protected from light at -20°C for up to 6 months. We recommend preparing a 1 mM stock solution in 10 mM Tris pH 7.4.

Product Description

CF® dyes are Biotium's next-generation fluorescent dyes, with combined advantages in brightness, photostability, and water solubility compared to other dyes like Alexa Fluor®, DyLight®, Cy® Dye, and IRDye®. CF® dye conjugates of dCTP can be used in standard DNA labeling and synthesis protocols to generate fluorescent dsDNA and oligonucleotide probes.

Note: CF@594 dCTP is not compatible with PCR labeling of DNA probes.

DNA Labeling by PCR

Materials required but not provided

- Taq DNA polymerase (see note under product application)
- 10X Taq reaction buffer
- 25 mM MgCl_2
- dATP, dTTP, dCTP, dGTP (separate solutions), 1 mM each
- DNA template
- Forward and reverse primers, 10 μM each
- PCR clean-up kit (optional)

PCR Reaction

1. For each labeling reaction, set up the PCR reaction mix as shown below:

Component	Volume per reaction	Final concentration (after addition of dUTP)
10X Taq reaction buffer	2 μL	1X
25 mM MgCl_2	2 μL	5 mM
1 mM dATP	2 μL	100 μM
1 mM dCTP	1 μL	50 μM
1 mM dGTP	2 μL	100 μM
1 mM dTTP	2 μL	100 μM
10 μM forward primer	1 μL	500 nM
10 μM reverse primer	1 μL	500 nM
Template	1 ng	50 pg/ μL
Taq	1 U	0.05 U/ μL
Molecular grade dH_2O	to 19 μL total	

2. Add 1 μL of 1 mM CF® dye dCTP to the reaction tube and mix well.

Optional: For an unlabeled control reaction, add 1 μL of 1 mM dCTP (unlabeled) instead of CF® dye dCTP.

3. Perform PCR according to the following cycling protocol:

Denaturing/hot-start Taq activation 94°C , 2 min. ^a	Hold
Denaturing 94°C 30 sec.	Cycle 30X
Annealing 30 sec. ^b	
Extension 72°C 1 min. ^c	
Final extension 72°C 5 min.	Hold

Notes:

- This protocol was optimized for Cheetah™ HotStart Taq Polymerase (see Related Products). Other hot-start Taq polymerases may require longer activation times.
 - Set the annealing temperature 5°C below the melting temperature (T_m) of your primers.
 - This cycling protocol was optimized for 200-300 bp amplicons. Longer amplicons may require longer extension times.
4. Optional: use a PCR clean-up kit to remove unincorporated nucleotides.

5. Run 10% of the labeled product on an agarose gel without DNA dye added to analyze the efficiency and specificity of the PCR reaction. CF® dye fluorescence can be imaged on a UV light box or laser-based gel scanner

Notes:

- a. Far-red fluorescence emission (650 nm or longer) is not visible to the human eye.
 - b. Be sure to image CF® dye fluorescence before staining DNA with gel stain, because CF® dyes and gel stains may quench one another.
6. Post-stain the gel with DNA gel stain to image the total PCR product or optional unlabeled control PCR product.
