Laboratory Procedures

This thromboxane B₂ (TXB₂) Quant-PAK contains 50 μ g of TXB₂-d₄ and 2-4 mg of TXB₂ (please see the vial for exact amount and concentration).

TXB₂ is supplied as a crystalline solid. A stock solution may be made by dissolving the TXB₂ in an organic solvent purged with an inert gas. TXB₂ is soluble in organic solvents such as ethanol, DMSO, and dimethyl formamide. The solubility of TXB₂ in these solvents is approximately 100, 25, and 50 mg/ml, respectively.

TXB₂-d₄ is supplied as a solution in methyl acetate. To change the solvent, simply evaporate the methyl acetate under a gentle stream of nitrogen and immediately add the solvent of choice. Solvents such as ethanol, DMSO, and dimethyl formamide purged with an inert gas can be used. The solubility of TXB₂-d₄ in these solvents is approximately 100, 25, and 50 mg/ml, respectively.

TXB₂-d₄ contains four deuterium atoms at the 3, 3, 4, and 4 positions. It is intended for use as an internal standard for the quantification of TXB₂ by GC- or LC-MS. The accuracy of the sample weight in the TXB₂-d₄ vial is between 5% over and 2% under the weight indicated on the vial. For better precision we have provided a precisely weighed unlabeled TXB₂, with the precise weight (2-4 mg) indicated on the vial. Using this vial the deuterated standard can be quantified by constructing a standard curve of peak intensity ratios (deuterated versus unlabeled).
