Laboratory Procedures

1,24-dihydroxy Vitamin D₃ (hydrate) is supplied as a crystalline solid. A stock solution may be made by dissolving the 1,24-dihydroxy vitamin D₃ (hydrate) in the solvent of choice, which should be purged with an inert gas. 1,24-dihydroxy Vitamin D₃ (hydrate) is soluble in organic solvents such as ethanol, DMSO, and dimethyl formamide. The solubility of 1,24-dihydroxy vitamin D₃ (hydrate) in these solvents is approximately 20 mg/ml.

1,24-dihydroxy Vitamin D₃ (hydrate) is sparingly soluble in aqueous buffers. For maximum solubility in aqueous buffers, 1,24-dihydroxy vitamin D₃ (hydrate) should first be dissolved in ethanol and then diluted with the aqueous buffer of choice. 1,24-dihydroxy Vitamin D₃ (hydrate) has a solubility of approximately 0.3 mg/ml in a 1:3 solution of ethanol:PBS (pH 7.2) using this method. We do not recommend storing the aqueous solution for more than one day.

Description

Vitamin D aids in the absorption of calcium and has central roles in bone formation and maintenance, hypertension, cancer, and immunity.^{1,2} In addition, the active form of vitamin D, 1,25-dihydroxy vitamin D₃, decreases the proliferation and increases differentiation of keratinocytes.³ 1,24-dihydroxy Vitamin D₃ is an analog of 1,25-dihydroxy vitamin D₃ which, when used in a 4 μg/g ointment, safely and effectively suppresses psoriasis.⁴ It also is effective at increasing the time interval between phototherapy cycles when ultraviolet light is used for psoriasis.⁵ 1,24-dihydroxy Vitamin D₃ inhibits the growth of both normal and psoriatic human keratinocytes (IC₅₀ ~ 10 nM) via the vitamin D receptor.⁶ It also suppresses the production of RANTES and IL-8 by human dermal fibroblasts and reduces cutaneous lymphocyte-associated antigen on CD4⁺ T cells, impairing migration and skin infiltration.^{7,8}
