Description

A series of 2,5-phenethylamines, collectively referred to as 2Cs, have psychoactive effects including potent activation of serotonin receptors and many are scheduled as illegal substances.^{1,2} 25G-NBOMe (hydrochloride) is a derivative of 2C-G, characterized by the addition of a benzyl-methoxy (BOMe) group to the amine.³ While the properties of this compound are not known, the N-(2-methoxybenzyl) addition significantly increases the affinity and activity of other disubstituted phenethylamines at the 5-HT_{2A} serotonin receptor.^{4,5} This product is intended for research and forensic applications.
