### Laboratory Procedures

Lenalidomide is supplied as a crystalline solid. A stock solution may be made by dissolving the lenalidomide in the solvent of choice. Lenalidomide is soluble in organic solvents such as DMSO and dimethyl formamide (DMF), which should be purged with an inert gas. The solubility of lenalidomide in these solvents is approximately 16 mg/ml.

Lenalidomide is sparingly soluble in aqueous buffers. For maximum solubility in aqueous buffers, lenalidomide should first be dissolved in DMF and then diluted with the aqueous buffer of choice. Lenalidomide has a solubility of approximately 0.5 mg/ml in a 1:1 solution of DMF:PBS (pH 7.2) using this method. We do not recommend storing the aqueous solution for more than one day.

### Description

Lenalidomide is an analog of thalidomide (Item No. 14610) that, at 10 μM, alters gene expression and cell viability in a range of cancer cell lines.<sup>1</sup> It also induces proliferation and enhances the functional capacity of T-lymphocytes, amplifying co-stimulatory signaling pathways.<sup>2</sup> Lenalidomide is effective in hematologic cancers, including lymphomas and myelomas.<sup>3,4</sup>
