Laboratory Procedures

1-Palmitoyl-2-oleoyl-*sn*-glycero-3-PG (POPG) (sodium salt) is supplied as a crystalline solid. A stock solution may be made by dissolving the POPG (sodium salt) in the solvent of choice. POPG (sodium salt) is soluble in chloroform at a concentration of approximately 2 mg/ml.

POPG (sodium salt) is sparingly soluble in aqueous solutions. To enhance aqueous solubility, dilute the organic solvent solution into aqueous buffers or isotonic saline. If performing biological experiments, ensure the residual amount of organic solvent is insignificant, since organic solvents may have physiological effects at low concentrations. We do not recommend storing the aqueous solution for more than one day.

Description

POPG is a phospholipid containing palmitoyl (16:0) and oleoyl (18:1) acyl substituents at the *sn*-1 and *sn*-2 positions, respectively. This mixed chain phosphatidylglycerol has been used to generate lipid membrane bilayers with controlled permeability and may be useful for various surfactant applications.¹⁻²
