Laboratory Procedures

Pladienolide B is supplied as a crystalline solid. A stock solution may be made by dissolving the pladienolide B in the solvent of choice. Pladienolide B is soluble in organic solvents such as methanol, ethanol, DMSO, and dimethyl formamide, which should be purged with an inert gas.

Description

Spliceosomes mediate the processing of pre-mRNA into mature mRNA.^{1,2} Each spliceosome is a multiunit complex containing several proteins and RNA molecules that work in unison to repeatedly cleave and rejoin segments of mRNA.^{1,2} Pladienolide B is a macrocyclic lactone that selectively binds splicing factor 3b and inhibits mRNA splicing.^{3,4} Through this action, pladienolide B potently blocks the growth of proliferating cells with mean IC_{50} values of 1.6 nM for six gastric cancer cell lines.^{5,6} In xenograft tumors generated in mice using human cancer cells, pladienolide B blocks mRNA splicing and induces apoptosis, clearing tumors within two weeks after treatment.⁶
