Laboratory Procedures

Amylin (8-37) (human) (trifluoroacetate salt) is supplied as a lyophilized powder. A stock solution may be made by dissolving the amylin (8-37) (human) (trifluoroacetate salt) in water. The solubility of amylin (8-37) (human) (trifluoroacetate salt) in water is approximately 1 mg/ml. We do not recommend storing the aqueous solution for more than one day.

Description

Amylin (8-37) is a peptide fragment of amylin (Item Nos. 24274 | 24275).¹ It inhibits osteoblast proliferation, but not bone resorption, induced by full-length human amylin and does not act as an agonist at amylin receptors. Amylin (8-37) induces formation of polymorphic fibrils containing coiled and laterally-associated sheet structures.² It is cytotoxic to RINm5F islet β-cells *in vitro* when used at a concentration of 25 μM, an effect that is inversely correlated with mature fibril content.³
