### Laboratory Procedures

Menaquinone 4-d<sub>7</sub> (MK-4-d<sub>7</sub>) is intended for use as an internal standard for the quantification of MK-4 (Item No. 18423) by GC- or LC-MS. The accuracy of the sample weight in this vial is between 5% over and 2% under the amount shown on the vial. If better precision is required, the deuterated standard should be quantitated against a more precisely weighed unlabeled standard by constructing a standard curve of peak intensity ratios (deuterated versus unlabeled).

MK-4-d<sub>7</sub> is supplied as an oil. A stock solution may be made by dissolving the MK-4-d<sub>7</sub> in the solvent of choice. MK-4-d<sub>7</sub> is slightly soluble in chloroform.

### Description

MK-4 is the predominant homolog of vitamin K<sub>2</sub> and is composed of a naphthoquinone base with four isoprenoid units in the side chain.<sup>1</sup> It is formed primarily via conversion of vitamin K<sub>1</sub> (Item No. 21051) *in vivo* and accumulates in various tissues, including the brain.<sup>2,3</sup> MK-4 halts the cell cycle at the G<sub>1</sub> phase in HepG2, Hep3B, and Huh7 hepatocellular carcinoma cells in a concentration-dependent manner.<sup>4</sup> It also inhibits IκB kinase (IKK) activity, IκBa phosphorylation, and the transcriptional activity of NF-κB. Vitamin K<sub>2</sub> may have a role in bone metabolism.<sup>1</sup>
