Laboratory Procedures

Procyanidin is supplied as a solid. A stock solution may be made by dissolving the procyanidin in the solvent of choice, which should be purged with an inert gas. Procyanidin is soluble in organic solvents such as ethanol, DMSO, and dimethyl formamide. The solubility of procyanidin in these solvents is approximately 0.5, 10, and 3 mg/ml, respectively.

Further dilutions of the stock solution into aqueous buffers or isotonic saline should be made prior to performing biological experiments. Ensure that the residual amount of organic solvent is insignificant, since organic solvents may have physiological effects at low concentrations. Organic solvent-free aqueous solutions of procyanidin can be prepared by directly dissolving the solid in aqueous buffers. The solubility of procyanidin in PBS, pH 7.2, is approximately 10 mg/ml. We do not recommend storing the aqueous solution for more than one day.

Description

Procyanidin is a polyphenol that exhibits antioxidant activity in a macrocyclic nickel complex-catalyzed Briggs-Rauscher oscillation system.¹
