Description

Recombinant prokaryotic lectin-Gal3 (RPL-Gal3) is a *P. luminescens* lectin expressed in and purified from *E. coli*. It is a tetramer under physiological conditions and selectively binds to glycoproteins containing terminal α -linked galactose groups. RPL-Gal3 activity requires metal ions, therefore, all buffers must be supplemented with 1 mM calcium chloride, magnesium chloride, and manganese chloride. It is recommended to use metal ion-supplemented Tris-buffered saline (TBS), pH 7.6, to dilute RPL-Gal3 to the desired working concentration (≤ 20 $\mu\text{g/ml}$). Following dilution, incubate RPL-Gal3 for a minimum of 30 minutes prior to use to allow metal complexation.
