Laboratory Procedures

Perfluorotridecanoic acid (PFTrDA) is supplied as a solid. A stock solution may be made by dissolving the PFTrDA in the solvent of choice, which should be purged with an inert gas. PFTrDA is slightly soluble in ethanol.

Description

PFTrDA is a perfluoroalkyl substance (PFAS). Embryo larval exposure of PFTrDA induces yolk sac edema and increases mRNA expression of thyroid hormone synthesis genes, including *tshβ*, in zebrafish when used at concentrations of 0.1 and 0.3 mg/L, respectively.¹ PFTrDA (10 mg/kg) decreases serum testosterone and luteinizing hormone levels, testis palmitic acid (Item No. 10006627), linoleic acid (Item Nos. 90150 | 90150.1 | 21909), and oleic acid (Item Nos. 90260 | 24659) levels, and the number of Leydig cells in rats in late puberty.² Maternal plasma levels of PFTrDA during gestation are positively associated with the development of eczema in female, but not male, infants, and liver levels of PFTrDA are higher in cancerous human livers compared with non-cancerous human livers.^{3,4} It has been found in marine mammals.⁵
