Laboratory Procedures

For long term storage, we suggest that progesterone 3-PEG₁₁-biotin be stored as supplied at -20°C. It should be stable for at least one year.

Progesterone 3-PEG₁₁-biotin is supplied as a solution in ethanol. If aqueous stock solutions are required for biological experiments, they can best be prepared by diluting the organic solvent into aqueous buffers or isotonic saline. Ensure that the residual amount of organic solvent is insignificant, since organic solvents may have physiological effects at low concentrations. We do not recommend storing the aqueous solution for more than one day.

Progesterone, along with pregnenolone, is the biosynthetic precursor of all other steroid hormones. Progesterone is synthesized from cholesterol by the sequential action of desmolase in the mitochondria, which produces pregnenolone, followed by $\Delta^{4,5}$ -isomerase in the outer mitochondrial membrane and smooth endoplasmic reticulum of steroid-secreting cells.¹ The main function of progesterone is to prepare the uterine lining for implantation of a fertilized ovum and to maintain pregnancy. Measurement of serum or plasma progesterone levels are used as an index to monitor ovulation and investigate luteal function. Progesterone-3-PEG₁₁-biotin is an affinity probe that allows progesterone to be detected or immobilized using the biotin ligand. The PEG₁₁ moiety serves to separate the biotin linker from progesterone with a hydrophilic spacer.
