#### Laboratory Procedures

 $CV-6209-d_5$  contains five deuterium atoms at the 1, 1, 2, 2, and 2 positions of the ethyl pyridinium moiety. It is intended for use as an internal standard for the quantification of CV-6209 (Item No. 15955) by GC- or LC-MS. The accuracy of the sample weight in this vial is between 5% over and 2% under the amount shown on the vial. If better precision is required, the deuterated standard should be quantitated against a more precisely weighed unlabeled standard by constructing a standard curve of peak intensity ratios (deuterated versus unlabeled).

CV-6209-d<sub>5</sub> is supplied as a crystalline solid. A stock solution may be made by dissolving the CV-6209-d<sub>5</sub> in the solvent of choice. CV-6209-d<sub>5</sub> is soluble in organic solvents such as ethanol, DMSO, and dimethyl formamide, which should be purged with an inert gas. The solubility of CV-6209-d<sub>5</sub> in these solvents is approximately 30 mg/ml.

#### Description

CV-6209 is a potent antagonist of the platelet-activating factor (PAF) receptor, inhibiting aggregation of rabbit and human platelets induced by PAF with IC<sub>50</sub> values of 75 and 170 nM, respectively.<sup>1</sup> It has little action on platelet aggregation induced by arachidonic acid, ADP, or collagen.<sup>1</sup> CV-6209 is bioavailable, as it prevents PAF-induced hypotension in rats, while not blocking hypotension triggered by arachidonic acid (Item No. 90010), histamine, bradykinin (Item No. 15539), or isoproterenol (Item No. 15592).<sup>1</sup> CV-6209 is used to study the role of PAF receptor signaling in vitro and in vivo.<sup>2,3</sup>
