Tarloxotinib bromide

Cat. No.: HY-17632

CAS No.: 1636180-98-7

Molecular Formula: C₂₄H₂₄Br₂ClN₉O₃

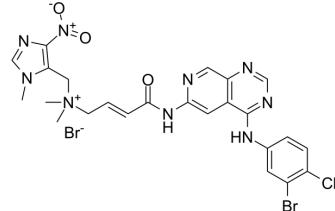

Molecular Weight: 681.77

Target: EGFR

Pathway: JAK/STAT Signaling; Protein Tyrosine Kinase/RTK

Storage: 4°C, sealed storage, away from moisture

* In solvent : -80°C, 6 months; -20°C, 1 month (sealed storage, away from moisture)

SOLVENT & SOLUBILITY

In Vitro

DMSO : ≥ 33 mg/mL (48.40 mM)

* "≥" means soluble, but saturation unknown.

Preparing Stock Solutions	Concentration	Solvent Mass		
		1 mg	5 mg	10 mg
	1 mM	1.4668 mL	7.3339 mL	14.6677 mL
	5 mM	0.2934 mL	1.4668 mL	2.9335 mL
	10 mM	0.1467 mL	0.7334 mL	1.4668 mL

Please refer to the solubility information to select the appropriate solvent.

In Vivo

1. Add each solvent one by one: 10% DMSO >> 40% PEG300 >> 5% Tween-80 >> 45% saline
Solubility: ≥ 2.5 mg/mL (3.67 mM); Clear solution

2. Add each solvent one by one: 10% DMSO >> 40% PEG300 >> 5% Tween-80 >> 45% saline
Solubility: ≥ 2.5 mg/mL (3.67 mM); Clear solution

BIOLOGICAL ACTIVITY

Description	Tarloxitinib bromide (TH-4000) is an irreversible EGFR/HER2 inhibitor.
-------------	------------------------------------------------------------------------

IC ₅₀ & Target	EGFR/HER2
---------------------------	-----------

In Vitro	To confirm the mechanism of action, Tarloxotinib bromide is shown to be metabolized efficiently under hypoxia using a panel of human NSCLC cell lines (rate of TKI release 0.4-2.1 nM/hr/10 ⁶ cells), a process that is inhibited by oxygen (TKI release <0.002 nM/hr/10 ⁶ cells). Cellular anti-proliferative and receptor phosphorylation assays demonstrate a 14-80 fold reduction of Tarloxotinib bromide activity relative to TKI. Using PC9 tumors, hyperbaric oxygen breathing suppresses release of TKI from Tarloxotinib bromide by >80% (538 vs 99 nM/kg; p<0.01) compared to air breathing controls. Collectively, these data further validate that Tarloxotinib bromide is a hypoxia-activated irreversible EGFR-TKI, and show that Tarloxotinib

bromide has greater activity compared with erlotinib^[2].

MCE has not independently confirmed the accuracy of these methods. They are for reference only.

In Vivo

A prototypic WT EGFR driven xenograft model (A431) is used to benchmark Tarloxotinib bromide activity against each EGFR-TKI by “retrotranslation” of reported plasma exposure for each agent in human subjects back to the xenograft model. Only treatment with clinically relevant doses and schedules of Tarloxotinib bromide is associated with tumor regression and durable inhibition of WT EGFR tumor phosphorylation. Consistent with these findings, Tarloxotinib bromide treatment can also regress the WT EGFR NSCLC tumor models H125 and H1648, demonstrating Tarloxotinib bromide provides the necessary therapeutic index to inhibit WT EGFR in vivo^[1].

MCE has not independently confirmed the accuracy of these methods. They are for reference only.
