## o-Pah

Cat. No.:	HY-D1549
CAS No.:	1181844-41-6
Molecular Formula:	C <sub>19</sub> H <sub>20</sub> BF <sub>2</sub> N <sub>3</sub> O
Molecular Weight:	355.19
Target:	Fluorescent Dye
Pathway:	Others
Storage:	Please store the product under the recommended conditions in the Certificate of Analysis.

## BIOLOGICAL ACTIVITY

Description	<p>o-Pah is a BODIPY derivative with an -NH<sub>2</sub> and -OH substituted meso-Ph group. o-Pah exhibits metal-induced J-aggregation in the presence of Cu<sup>2+</sup> and a specific fluorescence enhancement for Hg<sup>2+</sup> (Ex/Em=483/(495-600) nM)<sup>[1]</sup>.</p>
In Vitro	<p>o-Pah (20 μM) shows changed colour upon addition of 100 μM different metal ions and the further addition of 20 μM of Cu<sup>2+</sup> in DMSO/HEPES buffer solution<sup>[1]</sup>.          Procedures of metal ion sensing Stock solutions of the metal ions (100 mM and 10 mM) were prepared in deionised water<sup>[1]</sup>.</p> <ol style="list-style-type: none"> <li>1. A stock solution of o-Pah (0.5 mM) is prepared in DMSO.</li> <li>2. The solution of o-Pah is then diluted to 5 μM with HEPES buffer solution (50 mM KNO<sub>3</sub>, 50 mM HEPES, pH 7.2).</li> <li>3. During titration experiments, 2 mL solutions of o-Pah (5 μM, 0.5 μM) are placed in a 1 cm quartz optical cell and Cu<sup>2+</sup>, Hg<sup>2+</sup> stock solutions are added gradually with a micropipette.</li> <li>4. In selectivity experiments, the test samples are prepared by adding appropriate amounts of the metal ion stock solution into the 2 mL solution of o-Pah (5 μM).</li> <li>6. During fluorescence measurements, the excitation wavelength is 483 nm and emission spectra are collected between 495-600 nm.</li> </ol> <p>MCE has not independently confirmed the accuracy of these methods. They are for reference only.</p>
