DYNC2LI1 (m): 293T Lysate: sc-119873

BACKGROUND

Dyneins are multisubunit, high molecular weight ATPases that interact with microtubules to generate force by converting the chemical energy of ATP into the mechanical energy of movement. Cytoplasmic Dynein is an approximately 12 subunit complex of 2 heavy chains, 2 intermediate chains to anchor Dynein to its cargo, 4 smaller intermediate chains and several light chains. Cytoplasmic Dynein performs functions necessary for cell survival such as organelle transport and centrosome assembly. DYNC2LI1 (dynein, cytoplasmic 2, light intermediate chain 1), also known as LIC3, D2LIC or CGI-60, is a 351 amino acid cytoplasmic protein belonging to the dynein light intermediate chain family. DYNC2LI1 may function as a motor for intraflagellar retrograde transport and in cilia biogenesis. The cytoplasmic dynein complex 2 may be composed of a DYNC2H1 homodimer and a number of DYNC2LI1 light intermediate chains. DYNC2LI1 exists as five alternatively spliced isoforms.
