# IL-12R $\beta$ 1 (A-10): sc-166776

## BACKGROUND

IL-12, a heterodimeric cytokine composed of two disulfide-bonded glycoprotein subunits, p35 and p40, has pleiotrophic activities including stimulation of the proliferation of activated T and NK cells, induction of IFN- $\gamma$  production by PBMCs, enhancement of the lytic activity of NK/LAK cells and promotion of T helper (Th) 1 cell responses. The T cell response to IL-12 is mediated through two receptor proteins, designated IL-12R $\beta$ 1 and IL-12R $\beta$ 2. The genes encoding human IL-12R $\beta$ 1 and IL-12R $\beta$ 2 map to chromosomes 19p13.11 and 1p31.3, respectively. Increased IL-12R $\beta$ 2 expression is crucial in regulating Th1 differentiation, whereas IL-12R $\beta$ 1 expression is less restricted. Inhibition of IL-12 activity may provide treatment for diseases associated with pathologic Th1 responses, such as multiple sclerosis or Crohn's disease, while administration of recombinant IL-12 may aid in the treatment for allergic disorders and asthma.
