PrecisA Monoclonals[™]

- Precise - Accurate - Targeted -

PrecisA Monoclonals™

Unique Features of PrecisA Monoclonals

PrecisA Monoclonals[™] are mouse monoclonal primary antibodies developed for a number of carefully selected targets. Atlas Antibodies selects the relevant antibodies for each target and takes special care in offering clones recognizing unique non-overlapping epitopes isotypes. and/or Thanks to a stringent production process and characterization procedure, PrecisA Monoclonals[™] provide outstanding performance in approved applications, defined specificity, secured continuity, and stable supply.

Antigen Selection

The Protein Epitope Signature Tag (PrEST) concept gives the antibody performance built-in from the start. Using proprietary bioinformatics software, 50-150 amino acid regions (with the lowest possible sequence identity to other human proteins) are selected, cloned, and recombinantly produced in a tightly controlled set-up.

Clone Selection

Functional characterization is performed on many ELISA positive mouse cell supernatants to select the optimal clones for each application before subcloning and expansion of selected hybridomas.

Epitope Mapping

Clones are epitope-mapped using synthetic overlapping peptides in a bead-based array format to select clones with non-overlapping epitopes only.

Hybridoma Cell Cultivation

Atlas Antibodies uses in-vitro methods in the production scale-up phase, thus replacing mice for ascites fluid production.

Isotyping

PrecisA Monoclonals are isotyped to allow for multiplexing using isotypespecific secondary antibodies.

Antibody Characterization

The characterization of PrecisA Monoclonals starts with an extensive literature search to select the most relevant and clinically significant tissues to use immunohistochemistry for (IHC) characterization. As a result, you will often find more than one tissue type displayed in the IHC application data in our product catalog. In addition to the positive stained tissue, we also show the staining in a negative control tissue and, if relevant, staining in cancerous tissue.

The characterization for Western Blot (WB) data follows that same working procedure. It starts with a profound literature search to find the best matching lysate, which can be endogenous human cells, tissue protein lysates, or optionally recombinant full-length human protein lysates.

Each PrecisA Monclonal is thus supplied with the most appropriate characterization data for its specific target.

PrecisA Monoclonals[™] are developed by Atlas Antibodies, based on the knowledge from the Human Protein Atlas with careful antigen design and extended validation of antibody performance.

Antibody Panels

When there is an added value in combining several primary antibodies, PrecisA Monoclonals are developed in panels. Examples are the Organelle Markers Panel for co-localization of proteins and the Laminin Markers Panel for evaluating and selecting cell culture media.

Fig.1 The immunohistochemical staining of human rectum using the Anti-VIM (Vimentin) antibody (AMAb90516) shows strong positivity in mesenchymal and lymphoid cells.

Fig.2 The immunohistochemical staining of human uterus using the Anti-DICER1 (dicer 1, ribonuclease type III) antibody (AMAb90737) shows cytoplasmic immunoreactivity in the glandular epithelium cells.

Fig.3 The immunohistochemical staining of myocytes in human striated muscle using the Anti-SIX1 (SIX homeobox 1) antibody (AMAb90544) shows strong nuclear immunoreactivity.

Front cover:

Multiplexed IHC-IF staining of human rectum section using PrecisA Monoclonals Organelle Markers antibodies. The Anti-TUFM AMAb90966 shows mitochondria in green, Anti-HNRNPC AMAb91010 shows nuclei in magenta and Anti-EZR AMAb90979 demonstrates plasma membrane in red.

Co-Development Program

If you are looking for mouse monoclonal antibodies currently unavailable in our catalog, we invite you to participate in our Monoclonal Antibody Development Program.

Upon agreement, Atlas Antibodies will develop and produce the monoclonal antibodies using the same procedures as all PrecisA Monoclonals.

The optimal clones for specific applications will be selected in collaboration with you, either in your laboratory or at our facilities, with your expert input and/or material.

Benefits of the program

Atlas Antibodies covers all development costs. If the project results in a commercialized product, it will be added to Atlas Antibodies' PrecisA Monoclonal product portfolio.

Scientific research remains at the heart of Atlas Antibodies, and we welcome you to contact us for possible collaborations on both existing and future product offerings.

contact@atlasantibodies.com

Fig.4 One antibody developed in collaboration with an external partner is the phospholipase A2 receptor 1 mouse monoclonal Anti-PLA2R1 (AMAb90772). In the image, the immunohistochemical staining of human kidney using the Anti-PLA2R1 antibody, shows strong immunoreactivity in renal glomeruli.

Oncology Biomarkers

Need for Novel Cancer Biomarkers

The microscopic evaluation of a tumor stained tissue sections is the gold standard for cancer diagnosis. However, in order to optimize patient treatment and provide guidance for therapeutic intervention of the underlying disease, there is often a need for additional tumor stratification methods.

The protein expression analysis in cells from a tumor tissue often provides important additional information to the responsible pathologist. Immunohistochemistry (IHC) using protein-specific antibodies provides a tool to detect the presence, abundance, and localization of specific proteins.

With a limited repertoire of protein biomarkers available today, there is a clear and unmet clinical need to identify novel sets of biomarkers to provide a more accurate diagnosis and a better assessment of patient prognosis, ultimately leading to more individualized treatment. One example of such useful biomarker in cancer is the RNA binding motif protein 3 (RBM3).

Immunohistochemical studies have demonstrated that RBM3 has protooncogenic potential because its expression is up-regulated in various human tumors and high RBM3 expression levels are associated with good prognosis in the clinic.

Therefore, this protein is a potentially useful biomarker for cancer treatment.

Survival analysis of urothelial cancer patients stratified according to RBM3 expression.

Fig.5 Representative nuclear staining of RBM3 in urothelial cancer tissues: no RBM3 expression (**A**), intermediate RBM3 expression (**B**), high RBM3 expression (**C**). Immunohistochemistry analysis is performed using the monoclonal Anti-RBM3 antibody AMAb90655.

Fig.6 Estrogene receptor 1 (ESR1) is a nuclear transcription factor important for hormone binding, DNA binding, and activation of transcription. Estrogen receptors are essential for e.g. sexual development and reproductive function, and involved in pathological processes including breast and endometrial cancer. The Anti-ESR1 monoclonal antibody AMAb90867 shows nuclear immunoreactivity in normal cervix (A) and breast cancer tissue (B). Testis was used as a negative control (C).

Fig.7 EZH2 (enhancer of zeste 2 polycomb repressive complex 2 subunit) is involved in the regulation of cell cycle progression and dysregulation of EZH2 accelerates cell proliferation and promotes survival, resulting in cancer development, such as colorectal, melanoma and breast cancer. The image shows immunofluorescence staining of A-431 cells using the Anti-EZH2 monoclonal antibody AMAb91750, showing specific staining in nucleoplasm in green. Microtubules are visualized in red.

Fig.8 Inhibitor of DNA binding (ID) proteins are a class of helix-loop-helix (HLH) transcription regulatory factors that play critical roles in a wide range of tumor-associated processes, including cell differentiation, cell cycle progression, migration and invasion, epithelial-mesenchymal transition, angiogenesis, stemness, chemoresistance, tumorigenesis, and metastasis. The image shows the immunofluorescence staining of PC-3 cells using the Anti-ID1 AMAb91756 monoclonal antibody, with specific staining in nucleoplasm in green. Microtubules are visualized in red.

Fig.9 SALL4 (spalt like transcription factor 4) is a zinc finger transcriptional activator crucial for maintenance of self-renewal in stem cells. Along with the promising evidence of its role in self-renewal in various cancers, SALL4 may have a role in progression, development and maintenance of colorectal and testis cancers.

 (A) Immunohistochemical staining of mouse embryo E11 using the Anti-SALL4 AMAb91768 monoclonal antibody with a strong nuclear positivity in the cells of developing testis.
(B) Western blot analysis in the SALL4positive human cell line NTERA-2

positive human cell line NTERA-2 using the Anti-SALL4 AMAb91768 monoclonal antibody reveales a band of expected size.

Fig.10 BRAF is a signal transduction protein kinase involved in cell division and differentiation. Mutations of BRAF gene have been found in several cancers, including melanoma, colorectal, lung, breast and brain cancers, as well as lymphoma and leukemia.

(A) The Anti-BRAF monoclonal antibody AMAb91257 shows cytoplasmic positivity in breast tumor. (B) A band of expected size is detected by Western Blot in the positive cell line MOLT-4.

 $\mbox{Fig.11}$ HER2/ERBB2 is a member of the epidermal growth factor (EGF) receptor family of receptor tyrosine kinases. Amplification and/or overexpression of this gene has been reported in numerous cancers, including breast and ovarian tumors. The Anti-HER2 monoclonal antibody AMAb90627 shows differential expression in two different breast tumors (\mathbf{A}, \mathbf{B}) . Note also the band of predicted size in Western Blot in the HER2-positive cell line SK-BR-3 but not in the HER2-negative MCF7 cell line (C).

Fig.15 Podocalyxin-like protein is a a member of the sialomucin protein family, originally identified as an important component of glomerular podocytes. PODXL also plays a role in cancer development and aggressiveness by inducing cell migration and invasion through its interaction with the actin-binding protein ezrin. The Anti-PODXL monoclonal antibody AMAb90644 shows strong immunoreactivity in normal renal glomeruli (**A**) and in a subset of invasive cancer cells in colorectal cancer tumor (**B**). Western blot shows band of expected molecular weight in human kidney lysate (lane 2, C).

* Enhanced Validation

Fig.16 The TP53 gene encodes a tumor suppressor protein containing transcriptional activation, DNA binding, and oligomerization domains. Mutations in this gene are associated with a variety of human cancers, including hereditary cancers. The anti-P53 monoclonal antibody AMAb90956 shows strong nuclear expression of P53 in colorectal cancer (IHC, **A**), a cell cycle-dependent nuclear staining in A431 cells line (ICC-IF, **B**) and a band of predicted size in Western blot in positive cell line U-251 (lane 2, **C**).

Fig.18 TP 63 gene encodes a member of the p53 family of transcription factors, which play role in development and maintenance of stratified epithelial tissues. Normally, the protein is expressed in the basal cell layer of several epithelia. The antibody can be used for e.g. differentiation of benign prostate lesions and adenocarcinoma.

Here, in brown, the Anti-TP63 monoclonal antibody AMAb91224 shows strong nuclear immunoreactivity in normal human cervix epithelium (A) and prostate epithelium (B), while immunoreactivity is absent in adjacent prostate tumor cells. Lung adenocarcinoma was used as a negative control (C).

Fig.19 ATRX belongs to the SWI/SNF family of chromatin remodelling proteins. This protein undergoes cell cycle-dependent phosphorylation, which regulates its nuclear matrix and chromatin association, and is involved in the gene regulation at interphase and chromosomal segregation in mitosis. Mutations in this gene are associated with an X-linked mental retardation (XLMR) syndrome. Here, IHC stainings with the Anti-ATRX monoclonal antibody AMAb90784 show nuclear immunoreactivity in human hippocampus (A) and high grade glioma (B). ICC-IF staining demonstrates nuclear positivity in U-251 cell line (C). Western blot shows a band in A-549 cell line (lane 2, D).

* Enhanced Validation

Fig.20 Laminins are a major component of the basal lamina in basement membrane, playing an important role in cell differentiation, migration and adhesion. Laminins are heterodimeric proteins composed of an alpha-, a beta- and a gamma chains. In adult kidney, Laminin-521 is a key component of glomerular basement membrane.

The Anti-LAMA5 antibody AMAb91124 in blue (A), Anti-LAMB2 antibody AMAb91097 in green (B) and Anti-LAMC1 antibody AMAb91138 in red (C) were used to show the basement membrane positivity in renal glomerulus. Panel **D** shows an overlay image.

Fig.21 HNF1B is a member of the homeodomain-containing superfamily of transcription factors. This protein has been shown to function in nephron development and to regulate development of the embryonic pancreas. IHC staining with the Anti-HNF1B antibody AMAb90733 shows nuclear immunoreactivity in renal tubules (A) and pancreas (B), as well as positivity in A549 cell line (ICC-IF, C). Note also a band of expected molecular weight in HNF1B over-expressing HEK239T cells (D).

Fig.22 SATB2 is a DNA binding protein that specifically binds nuclear matrix attachment regions. SATB2 is involved in transcription regulation and chromatin remodelling and has been shown to play role in e.g. cortical neuron development. In addition, SATB2 is highly expressed in lower gastrointestinal tract and can be used a marker to distinguish colorectal cancer from other cell types.

The IHC staining with the Anti-SATB2 antibody AMAb90679 shows strong nuclear immunoreactivity in human rectum (**A**) and colorectal cancer (**B**). A negative staining was confirmed in human tonsil (**C**) used as negative control. In the rat brain, SATB2 is expressed in both cerebral cortex and CA1 layer of the hippocampus, while the protein is absent in CA3 and dentate gyrus neurons (**D**). In western blot, a band of expected molecular weight is shown using the SATB2-positive cell line HEL (lane 2, **E**).

Fig.23 The family of SOX transcription factors is involved in regulation of several aspects of development. For example, SOX9 plays a major role in male sexual development. In addition, this protein is involved in retinal cell fate determination and some types of brain cancer, including malignant glioma.

The Anti-SOX9 antibody AMAb90795 shows nuclear immunoreactivity in the developing retina in mouse embryo E14 (A) and in U-251 MG glioblastoma cell line (B). As confirmation of antibody specificity note the down-regulation of SOX9 band in U-251 MG cells following pretreatment of cells with siRNA #1-2 (C).

Fig.24 SOX10 is a crucially important protein for the development of the neural crest and peripheral nervous system, as well as for formation of oligodendrocytes in the central nervous system.

The Anti-SOX10 monoclonal antibody AMAb91297 shows immunoreactivity in a subset of cells in the developing trigeminal ganglion and ear placode in mouse embryo E11 (A), in oligodendrocytes in human cerebral cortex (B) and in skin cancer cell line WM-115 (C).

Fig.25 GFAP is one of the major intermediate filament proteins of mature astrocytes. It can be used as a marker to distinguish astrocytes from other glial cells during development and in the adult brain.

Here, the Anti-GFAP antibody AMAb91033 was used to label astrocytes of the human cerebral cortex (A), rat hippocampus (IHC-IF, B) and mouse hypothalamus (IHC-IF, C). Note the band of expected molecular weight in both human cortex (lane 2, D) and mouse cortex lysates (lane 2, E).

* Enhanced Validation

Fig.26 SOX2 transcription factor is crucially important for the development and is involved in the pluripotency of cells. It is expressed in the developing nervous system, in the neural tube and in the neural progenitors.

The ICC-IF staining using the Anti-SOX2 monoclonal antibody AMAb91307 shows nuclear positivity in the developing forebrain and eye of mouse embryo E11 (A) and in the U-251 cell line (B). Note also the expected size band of SOX2 detected by Western Blot in the NTERA-2 cell line (C).

Fig.27 Multiplexed IHC-IF staining of a sagittal section of mouse brain showing the GABAergic system in red, glutamatergic system in green and acetylcholine system in magenta by using isotype-specific secondary antibodies (**A**).

The Anti-GAD1 antibody AMAb91076 was used to visualize the GABAergic system, the Anti-VGLUT1 antibody AMAb9104 was used for the glutamatergic system and the Anti-CHAT antibody AMAb91129 was used for the acetylcholine system.

The Inset $({\bf B})$ shows a high-power image of the boxed area. Note the acetylcholine neuronal cell bodies in the basal forebrain (in magenta).

Fig.28 Tyrosine hydroxylase is involved in the conversion of tyrosine to dopamine. It is the rate-limiting enzyme in the synthesis of catecholamine neurotransmitters, which plays a key role in the physiology of noradrenergic and dopaminergic neurons. The Anti-TH monoclonal antibody AMAb91112 shows strong immunoreactivity in the noradrenergic neurons of human and rat locus coeruleus (**A**,**B**), and in the mouse paraventricular hypothalamic nucleus (**C**).

Fig.29 Tryptophan hydroxylase 2 catalyses the first and rate limiting step in the biosynthesis of serotonin, an important hormone and neurotransmitter, involved in a number of psychiatric diseases, such as major depression and bipolar disorder. The Anti-TPH2 antibody AMAb91108 shows strong positivity in the serotonergic neurons of the human and rat dorsal raphe (**A**, **B**), as well as in the serotonergic processes of the mouse basal forebrain (**C**).

* Enhanced Validation

Fig.30 VGluT2 is a transporter that mediates the uptake of glutamate into synaptic vesicles at the presynaptic nerve terminals of excitatory glutamatergic neurons. The Anti-VGluT2 monoclonal antibody AMAb91081 shows strong positivity in glutamatergic fibers in human cerebellum (**A**), human cerebral cortex (**B**), rat cerebellum (**C**) and mouse thalamus (**D**).

Fig.31 Citrate synthase is a Krebs tricarboxylic acid cycle enzyme that catalyses the synthesis of citrate from oxaloacetate and acetyl coenzyme A. The enzyme is found in nearly all cells capable of oxidative metabolism and is present in mitochondria.

The IHC staining with the Anti-CS monoclonal antibody AMAb91007 shows strong granular cytoplasmic immunoreactivity in normal human tissues, e.g. fallopian tube (**A**) and prostate (**B**). ICC-IF shows positivity in mitochondria in HeLa cells (**C**, in green). Note also a band of expected molecular weight for CS in positive cell line U-251 shown by Western blot (lane 2, **D**).

Fig.32 CDK5RAP2 protein regulates centrosome function and chromosome segregation. Immunofluorescence staining with Anti-CDK5RAP2 monoclonal antibody AMAb91163 shows positivity in centrosome in HeLA cell line (\mathbf{A}). The IHC staining of human breast cancer shows centrosome-like immunoreactivity in tumor cells (\mathbf{B}).

Fig.33 MCU, the mitochondrial calcium uniporter, is an inner membrane transport protein essential for the regulation of calcium uptake and the maintenance of mitochondrial calcium homeostasis.

The ICC-IF staining of A-549 cell line using the Anti-MCU monoclonal antibody AMAb91189 shows specific staining of mitochondria in green (A). The antibody specificity is confirmed by Western Blot in A-549 cells using siRNA pretreatment (B).

Fig.34 PARP1 is a chromatin-associated enzyme, which modifies various nuclear proteins by poly(ADP-ribosyl)action. The modification is involved in the regulation of important cellular processes such as differentiation, proliferation, and tumor transformation. It plays also a role in the regulation of the molecular events involved in the recovery of cell from DNA damage. The ICC-IF staining using the Anti-PARP1 antibody AMAb90959 shows cell cycle dependent nuclear staining (in green) in HeLa (A) and U2OS (B) cell lines. A nuclear immunoreactivity is also observed in human tissues, including fallopian tube (C) and prostate (D).

(E) Western blot demonstrates a band of expected molecular weight in RT-4 cell line. (F) Western blot using cell fraction extracts from human cell line HeLa shows a band in the nuclear fraction (lane 4) (Lane 1: Marker, 2: cytoplasmic fraction, 3: membrane fraction, 4: HeLa nuclear fraction, 5: chromatin fraction, 6: cytoskeletal fraction).

* Enhanced Validation

Fig.35 Occludin is the main component of the tight junctions, important in particular for the stability and barrier functions of tight junctions in the epithelial cells. Loss of occludin is observed in e.g. cancer progression and metastasis.

(A) The Anti-OCLN antibody AMAb90890 shows membranous immunoreactivity in the prostate epithelial cells (antibody staining in green, nuclear counterstain DAPI in blue). (B) Western blot shows the OCLN band of expected molecular weight in OCLN-positive cell line (lane 2, CACO) and absence of band in OCLN-negative cell line (lane 3, U-87).

Fig.36 CD11B encodes the integrin alpha M chain in a macrophage receptor 1 ('Mac-1'), or inactivated-C3b (iC3b) receptor 3 ('CR3'). It is expressed on the surface of many leukocytes, including macrophages, granulocytes and natural killer cells. It is often used as a marker to identify macrophages and microglia. The IHC staining using the Anti-CD11B antibody AMAb90911 shows strong immunoreactivity in the reaction centre in tonsil (A), as well as positivity in microglia in cortex (B) and leukocytes in the fallopian tube (C). Western blot demonstrate a band of expected molecular weight in human tonsil lysate (D).

Fig.37 CD40 protein is a receptor on antigen-presenting cells of the immune system and is essential for mediating a broad variety of immune and inflammatory responses including T cell-dependent immunoglobulin class switching, memory B cell development, and germinal center formation.

The IHC staining using the Anti-CD40 monoclonal antibody AMAb90905 shows strong immunoreactivity in human tonsil (**A**) and absence of signal in the cerebellum (**B**) used as negative control. Western blot demonstrates a band of CD40 at expected molecular weight in human spleen lysate (**C**).

VERY RELIABLE ANTIBODIES

Atlas Antibodies manufactures and provides over 21,000 highly validated monoclonal and polyclonal primary antibodies and control antigens targeting the majority of human proteins for tissue and cell analysis to explore and accelerate research in biology, pathology, and medicine. The portfolio covers different research areas such as neuroscience, cancer, cell biology, stem cell & development. All our products are rigorously evaluated for specificity, reproducibility and performance and characterized for use in IHC, WB, and ICC-IF. Enhanced validation is applied as an extra level of security of antibody specificity in a defined context. Available as 25 μ L and 100 μ L unit size.

CREATED BY THE HUMAN PROTEIN ATLAS

With our roots in the Human Protein Atlas project, an integration of antibody-based imaging, proteomics, and transcriptomics, our antibodies are affinity-purified, reproducible, selective, and specific for their target proteins through our enhanced validation process. Our Triple A Polyclonals[™] are developed within the Human Protein Atlas project.

VALIDATED BY ENHANCED VALIDATION

We take great care to validate our antibodies in IHC, WB, and ICC-IF. Our antibodies are validated in all major human tissues and organs and 20 cancer tissues. Each antibody is supported by over 500 staining images. As an additional layer of security, we perform Enhanced Validation. By using 5 different enhanced validation methods we validate our antibodies for each combination of protein, sample, and application. Discover our Triple A Polyclonals[™] and PrecisA Monoclonals[™] antibodies targeting the majority of human proteins in cells, tissues, and organs.

EVIDENCED BY SCIENCE

Made by researchers for researchers our products are used worldwide and referenced in 1000s of scientific peer-reviewed papers.

WE SUPPORT YOUR RESEARCH

Our scientific content and newsletter provide you with timely information about new product releases, research highlights, and much more. In addition, from our website you can download informative white papers, protocols, guides, posters, infographics, roundups of recent research papers, read blog posts and interviews.

HOW TO BUY OUR PRODUCTS

Our products are available worldwide. We deliver to all destinations in Europe (excluding Russia), US, Canada, Australia, New Zealand and Israel. We expand our offering through trusted partners worldwide.

You can shop our full catalog online or find your local supplier.

Atlas Antibodies Advanced Polyclonals.

Triple A Polyclonals[™] are rabbit polyclonal primary antibodies developed within the Human Protein Atlas project. IHC characterization data from 44 normal and 20 cancer tissues is available on the Human Protein Atlas portal.

Precise. Accurate. Targeted.

PrecisA Monoclonals[™] are mouse monoclonal primary antibodies developed against a number of carefully selected targets. Clones are selected to recognize only unique non-overlapping epitopes and isotypes.

PrEST Antigens

Recombinant protein fragments

PrEST Antigens[™] are used as immunogens for the generation of Triple A Polyclonals and PrecisA Monoclonals.
