Gene Ontology: [Hyperlink](#)

Gene Summary: This gene is a member of the immunoglobulin superfamily and encodes a protein which transmits an inhibitory signal to T cells. The protein contains a V domain, a transmembrane domain, and a cytoplasmic tail. Alternate transcriptional splice variants, encoding different isoforms, have been characterized. The membrane-bound isoform functions as a homodimer interconnected by a disulfide bond, while the soluble isoform functions as a monomer. Mutations in this gene have been associated with insulin-dependent diabetes mellitus, Graves disease, Hashimoto thyroiditis, celiac disease, systemic lupus erythematosus, thyroid-associated orbitopathy, and other autoimmune diseases. Other Designations: OTTHUMP00000163781,cytotoxic T-lymphocyte-associated antigen 4,cytotoxic T-lymphocyte-associated serine esterase-4,ligand and transmembrane spliced cytotoxic T lymphocyte associated antigen 4
