Gene Description: eukaryotic translation elongation factor 1 delta (guanine nucleotide exchange protein)

Omim ID: [130592](#)

Gene Ontology: [Hyperlink](#)

Gene Summary: This gene encodes a subunit of the elongation factor-1 complex, which is responsible for the enzymatic delivery of aminoacyl tRNAs to the ribosome. This subunit functions as guanine nucleotide exchange factor. It is reported that this subunit interacts with HIV-1 Tat, and thus it represses the translation of host-cell, but not HIV-1, mRNAs. Several alternatively spliced transcript variants encoding multiple isoforms have been found for this gene. [provided by RefSeq]

Other Designations: antigen NY-CO-4,eukaryotic translation elongation factor 1 delta,guanine nucleotide exchange protein
