Gene Name: HCK

Gene Alias: JTK9

Gene hemopoietic cell kinase

Description:

Omim ID: [142370](#)

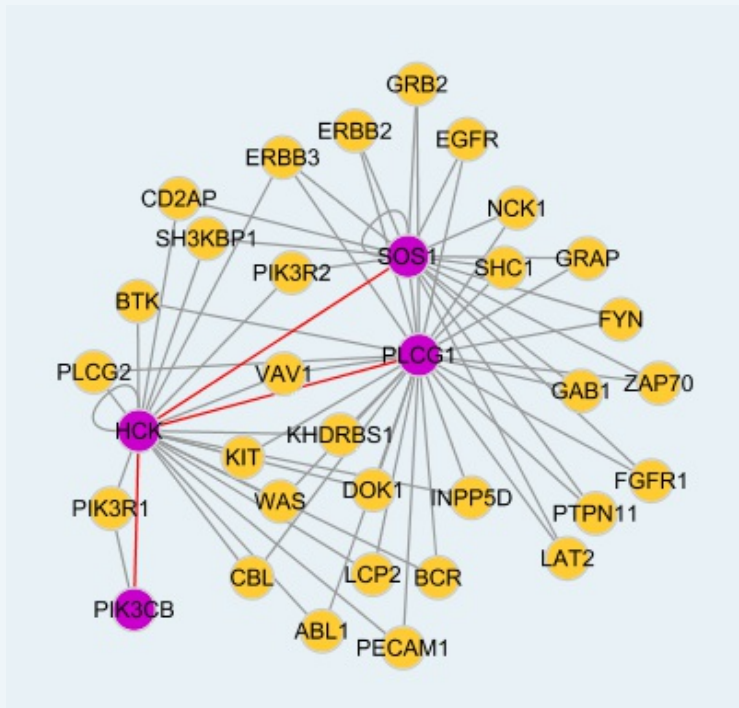

Gene Ontology: [Hyperlink](#)

Gene Summary: The protein encoded by this gene is a protein-tyrosine kinase that is predominantly expressed in hemopoietic cell types. The encoded protein may help couple the Fc receptor to the activation of the respiratory burst. In addition, it may play a role in neutrophil migration and in the degranulation of neutrophils. Alternate translation initiation site usage, including a non-AUG (CUG) codon, results in the production of two different isoforms, that have different subcellular localization. [provided by RefSeq]
