Gene Name: HLF

Gene Alias: MGC33822

Gene Description: hepatic leukemia factor

Omim ID: [142385](#)

Gene Ontology: [Hyperlink](#)

Gene Summary: This gene encodes a member of the proline and acidic-rich (PAR) protein family, a subset of the bZIP transcription factors. The encoded

protein forms homodimers or heterodimers with other PAR family members and binds sequence-specific promoter elements to activate transcription. Chromosomal translocations fusing portions of this gene with the E2A gene cause a subset of childhood B-lineage acute lymphoid leukemias. Alternatively spliced transcript variants have been described, but their biological validity has not been determined. [provided by RefSeq]
