Gene Name: TNFRSF11B

Gene Alias: MGC29565, OCIF, OPG, TR1

Gene tumor necrosis factor receptor superfamily, member 11b

Description:

Omim ID: [239000](#), [602643](#)

Gene Ontology: [Hyperlink](#)

Gene Summary: The protein encoded by this gene is a member of the TNF-receptor superfamily. This protein is an osteoblast-secreted decoy receptor that functions as a negative regulator of bone resorption. This protein specifically binds to its ligand, osteoprotegerin ligand, both of which are key extracellular regulators of osteoclast development. Studies of the mouse counterpart also suggest that this protein and its ligand play a role in lymph-node organogenesis and vascular calcification. Alternatively spliced transcript variants of this gene have been reported, but their full length nature has not been determined. [provided by RefSeq]

Other osteoclastogenesis inhibitory factor, osteoprotegerin
