Gene Name: RBMS2

Gene Alias: FLJ39093,FLJ40023,FLJ43262,SCR3

**Gene
Description:** RNA binding motif, single stranded interacting protein 2

Omim ID: [602387](#)

Gene Ontology: [Hyperlink](#)

Gene Summary: The protein encoded by this gene is a member of a small family of proteins which bind single stranded DNA/RNA. These proteins are characterized by the presence of two sets of ribonucleoprotein consensus sequence (RNP-CS) that contain conserved motifs, RNP1 and RNP2, originally described in RNA binding proteins, and required for DNA binding. The RBMS proteins have been implicated in such diverse functions as DNA replication, gene transcription, cell cycle progression and apoptosis. This protein was isolated by phenotypic complementation of *cdc2* and *cdc13* mutants of yeast and is thought to suppress *cdc2* and *cdc13* mutants through the induction of translation of *cdc2*.
