Gene Name: RXRG

Gene Alias: NR2B3,RXRC

Gene retinoid X receptor, gamma

Description:

Omim ID: [180247](#)

Gene Ontology: [Hyperlink](#)

Gene Summary: This gene encodes a member of the retinoid X receptor (RXR) family of nuclear receptors which are involved in mediating the antiproliferative effects of retinoic acid (RA). This receptor forms dimers with the retinoic acid, thyroid hormone, and vitamin D receptors, increasing both DNA binding and transcriptional function on their respective response elements. This gene is expressed at significantly lower levels in non-small cell lung cancer cells. Alternate transcriptional splice variants, encoding different isoforms, have been characterized.
