**GeneBank Accession#:** [NM\\_005635.2](#)

**Protein Accession#:** [NP\\_005626.1](#)

**Gene Name:** SSX1

**Gene Alias:** MGC150425,MGC5162,SSRC

**Gene Description:** synovial sarcoma, X breakpoint 1

**Omim ID:** [312820](#)

**Gene Ontology:** [Hyperlink](#)

**Gene Summary:** The product of this gene belongs to the family of highly homologous synovial sarcoma X (SSX) breakpoint proteins. These proteins may function as transcriptional repressors. They are also capable of eliciting spontaneously humoral and cellular immune responses in cancer patients, and are potentially useful targets in cancer vaccine-based immunotherapy. SSX1, SSX2 and SSX4 genes have been involved in the t(X;18) translocation characteristically found in all synovial sarcomas. This translocation results in the fusion of the synovial sarcoma translocation gene on chromosome 18 to one of the SSX genes on chromosome X. The encoded hybrid proteins are probably responsible for transforming activity. [provided by RefSeq]

**Other Designations:** OTTHUMP00000023245,sarcoma, synovial, X-chromosome-related 1
